## Zion National Park installs solar panels

A new sustainable energy project was completed at Zion National Park, according to a park press release.

As part of a climate friendly initiative, the photo voltaic electrical generating system has been installed at park Headquarters, the Zion Human History Museum and the park's Emergency Operations Center.

"This system will produce renewable energy, reduce greenhouse gasses and significantly save utility costs, allowing us to move forward with one of our top priorities, which is to improve our sustainability by continued reduction of our carbon footprint," said Superintendant Jock Whitworth.
